

# How to install MathMagic manually on Mac OS X.

(Based on MathMagic v6.5 or later)

MathMagic used to come with a industry standard installer for the Easy Installation and flexible Custom Installation options since its debut. However, there were more demands for simple intuitive installation process as most users migrated to Mac OS X. These days, Drag-and-Drop installation is preferred by many users as they could have more control. Thanks to Mac OS X's built-in dmg format. We believe that this would help users have the full control over what goes where, especially under multi-user environment

- For the detailed step-by-step instructions, please read below.

---

## \* 2-Simple Steps:

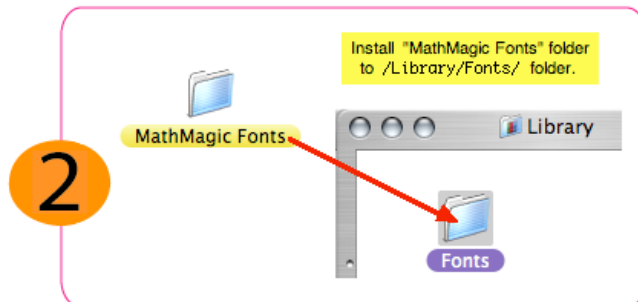

---

1. Copy MathMagic Folder to your /Applications/ folder.

- Move "MathMagic Personal Edition" folder or "MathMagic Pro Edition" folder(depending on the product you download) into the / **Applications**/ folder or anywhere in your hard disk at your convenience. You may simply drag it over to the **alias** file of **Applications** folder, located in the disk image for your convenience.
- This folder contains the latest version of MathMagic application, Fonts, **ReadMeFirst** and some other documents, and samples. Pro Editions have InDesign Plug-ins or QuarkXPress XTensions as well. If you have a previously installed one in your Applications folder already, you may replace the whole folder, or just copy the latest MathMagic application only, into the previous MathMagic folder if you want to keep the old versions concurrently for some back-up or compatibility issue.

2. Install MathMagic fonts.(Required for the first time users)

3. Then, run MathMagic application.

- Launch MathMagic Personal or MathMagic Pro application.
- It will install MathMagic Fonts automatically upon your confirmation if MathMagic fonts are not readily available from your System. This automatic installation or activation of fonts may not work in some cases and Manual installing of "MathMagic Fonts" folder is recommended, as explained above.
